The self.groups variable :
Is a list of list of tiles. It should have a group (list of tiles) aliasing each row, column block. Tiles should be present in three groups each (once in a row, once in a column and once in a block). Also, each group must be distinct. That is there should be no two groups that have the same tiles.
The self.tiles variable :
Is a list of list of tiles. It is the basic representation of the board. Each tile has an index of row and column [row, col]. We can always access the tiles using the self.tiles. But sometimes we need the groups to make checking the tiles values easier.
